

ARCHON ARCHIVE Remote Terminal User Manual

v1.52

OVERVIEW

The ARCHON Archive Remote Terminal provides users with a powerful tool for searching and navigating the file systems. This guide explains how to effectively interact with the search functionality and filters.

Search Bar Interaction:

The search bar is your primary means of interacting with the ARCHON Archive files. You can use it to search for specific names, filter file types, organize your results, and reveal hidden files. Below is a breakdown of the commands and filters you can use.

BASIC SEARCH

Typing a word: The terminal will display files and folders that contain or start with the word or name you type.

Example:

- Typing 'Beattie' will return files with "Beattie" in their name.

FILE TYPE FILTERS

You can filter results by specific file types by typing the following commands in the search bar:

- `<document>`: Shows only document files.
- `<text>`: Shows only text files.
- `<video>`: Shows only video files.
- `<audio>`: Shows only audio files.
- `<file>`: Shows all files.

Combine multiple filters by typing more than one file type. For example:

- `<document> <audio>` will show both document and audio files.

SORTING AND ORDERING FILTERS

You can further refine your search results using sorting filters. Sorting can be done alphabetically, by file type, size, or date. These filters are applied with the following commands:

- `%>name%`: Sorts results alphabetically in increasing order (A-Z).
- `%<name%`: Sorts results alphabetically in decreasing order (Z-A).
- `%>type%`: Sorts results by file type in ascending order.
- `%<type%`: Sorts results by file type in descending order.
- `%>size%`: Sorts results by file size from smallest to largest.
- `%<size%`: Sorts results by file size from largest to smallest.
- `%>date%`: Sorts results by date from oldest to newest.
- `%<date%`: Sorts results by date from newest to oldest.

Combine sorting filters with type filters to organize results even more precisely.

Example:

- `<document> %>name%` will show only document files, sorted alphabetically from A-Z.

REVEALING HIDDEN FILES

[showhidden]: Use this tag to display any hidden files in the system. Hidden files are typically not shown in normal searches but can be revealed when this tag is used.
